

SRS Femida Pro - Integrated Court Solution

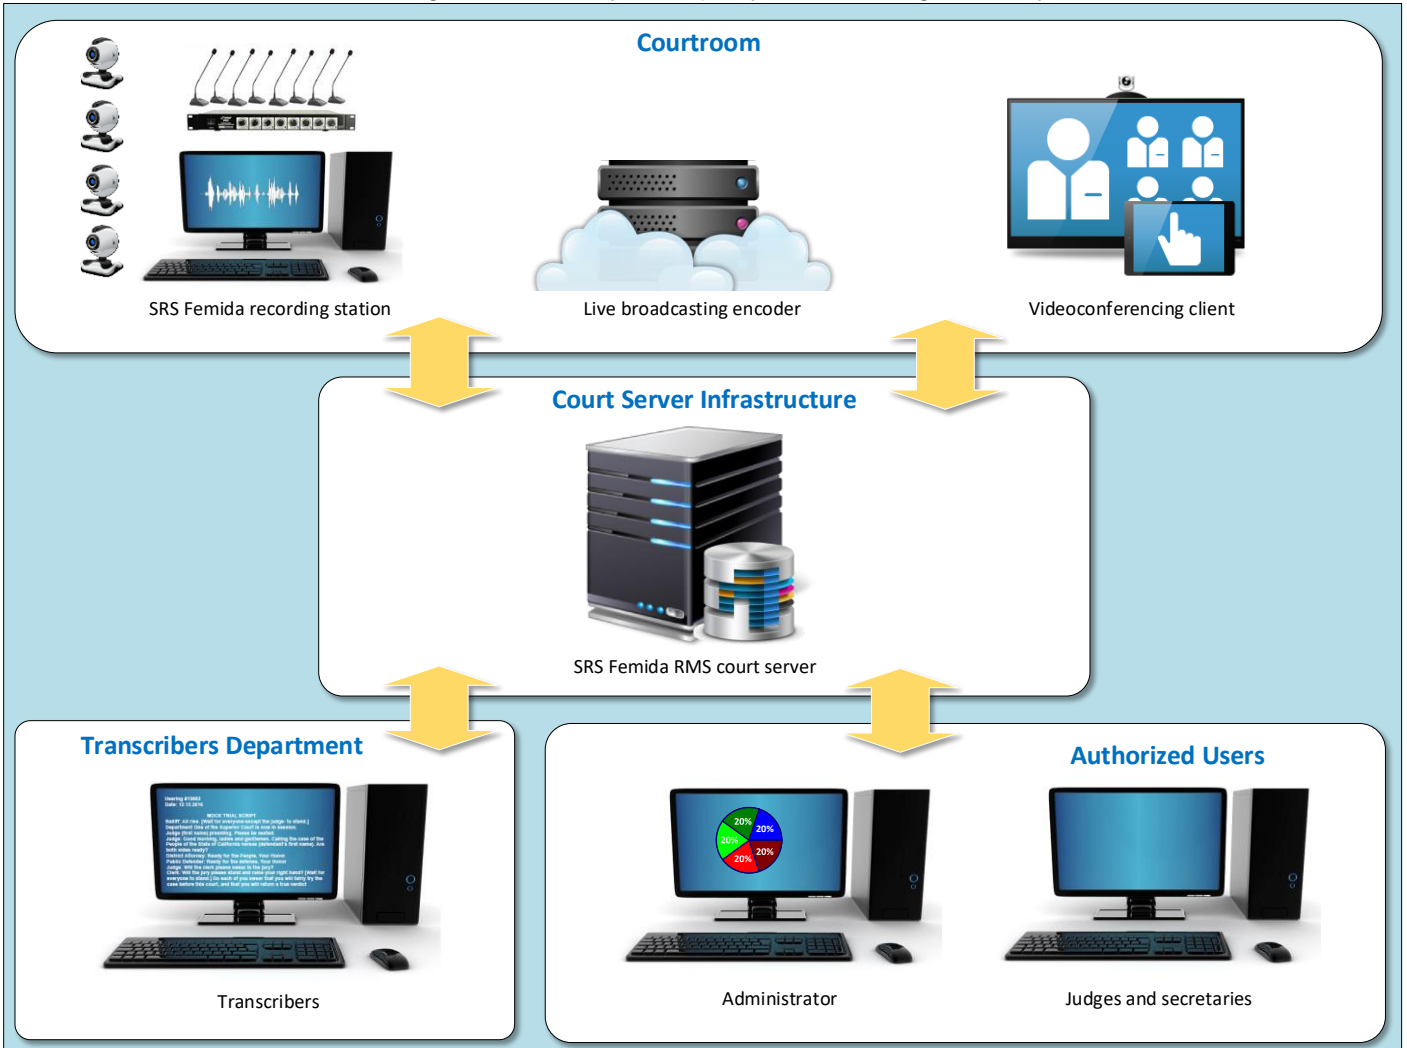

□ About Solution

SRS Ltd. presents a complete, integrated solution "SRS Femida Pro" for digital audio, video and evidence capture and records management for courts.

SRS Femida Pro consists of the following components:

- SRS Femida – system for digital multichannel audio and video recording and annotating;
- SRS Femida RMS – records management system (audio, video, text and metadata).

SRS Femida Pro can be integrated with any third-party case management systems.

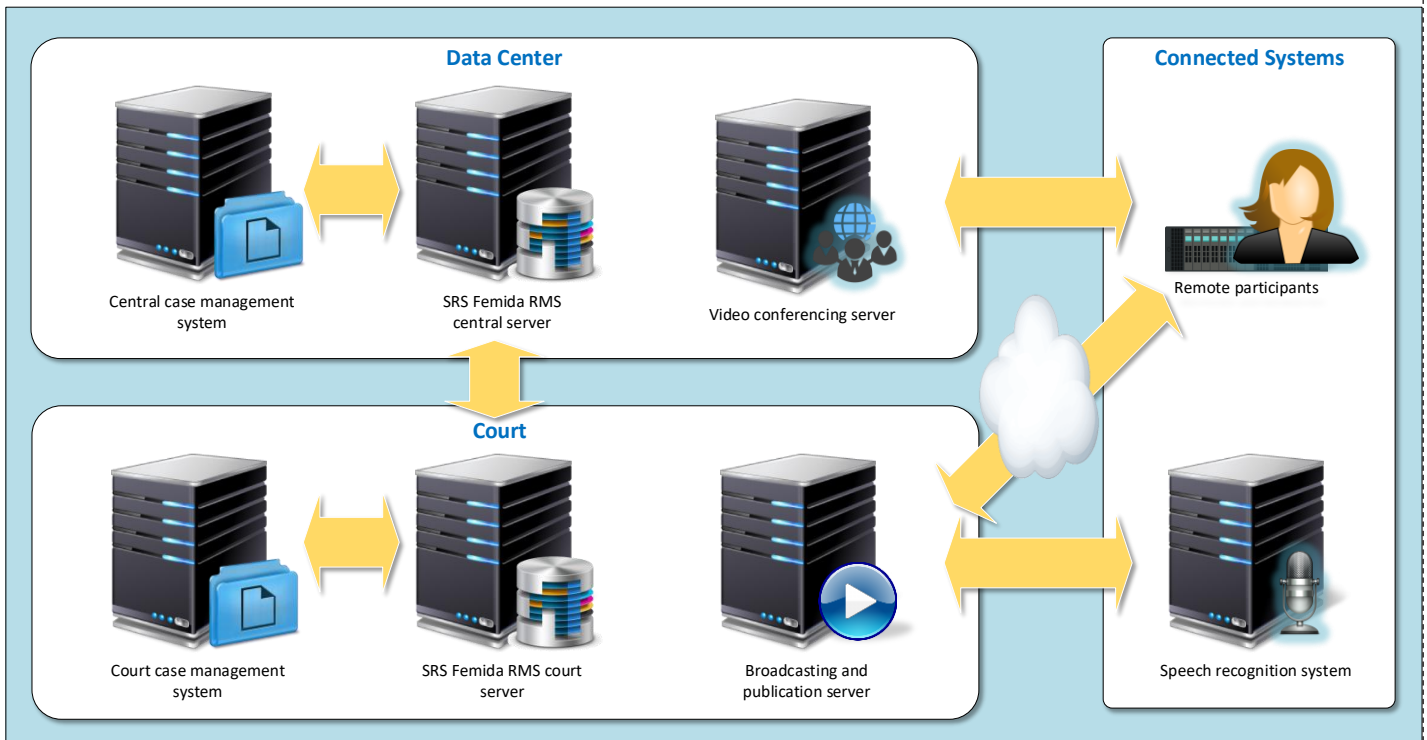

SRS Femida Pro Infrastructure Diagram

□ Main Functionality

- Integration with document management systems;
- Multichannel digital audio and video recording of court hearings;
- Audio and video recording of videoconferencing sessions with remote participants of court hearing;
- Automated annotation using unified templates;
- Distributed data storage (audio and video records, minutes);
- Centralized data management;
- Access to data from any workplace;
- Data and system functions access management based on user roles and access rights;
- Ensuring data consistency and integrity, document versioning management;
- Group shared transcription;
- Export and import of audio and video records;
- Online broadcasting of court sessions;
- Data processing automation: backup, archiving, scheduled data processing tasks;
- Automated monitoring of system status, event logging, incident notifications by email.

Integration

- Authorized access from external systems for storage and processing of audio and video recordings and minutes;
- Automation of transcription using speech recognition systems;
- Import of case metadata from document/case management system (name of case, participants etc.);
- Possibility to view minutes with synchronized playback of audio - video records in external systems via built-in specialized web-player.

Interaction with External Systems

Advantages

- Multilevel system architecture;
- System scalability from one court up to the national level;
- Secure web-service interface for integration with existing case management systems;
- Autonomous operation of system components in case of data transfer failures between them;
- Automated synchronization of data once the connection between system components is restored;
- Online or scheduled data replication with identical and consistent digital copies;
- Cost-effective software solution for data storage and backup;
- Autonomous backup audio and video recording by special means;
- Application of modern audio and video compression algorithms for effective data storage;
- User-friendly web-interface.
